

Audio Matrix Switchers

MAV Plus Audio Series

A/V Matrix Switchers with IP Link® for Stereo and Mono Audio

DESCRIPTION

The Extron **MAV Plus Audio** matrix switchers are designed to route balanced or unbalanced audio signals. Most models include an enhanced QS-FPC™ - QuickSwitch Front Panel Controller with tri-color, backlit buttons, while all models feature audio input gain and attenuation, audio output volume adjustment, and Extron's exclusive IP Link® Ethernet control technology. MAV Plus Series matrix switchers are ideal for a very broad range of audio routing applications, including command and control centers, university classroom buildings, conference centers, and auditoriums, large residential entertainment systems, and many other high-level A/V system designs.

Available in sizes up to 64x64, MAV Plus Audio matrix switchers support both audio follow and audio breakaway modes. Full adjustment of both audio input gain and attenuation, and audio output volume and muting, is available at the front panel or through IP Link or serial control. The advanced audio capabilities of the MAV Plus Series facilitate system integration by reducing gain-staging effects and can eliminate the need for audio preamplifiers in many system designs.

For additional information, see Matrix Switchers Section, page 275.
